

N Gauge Supermarket Instructions

Not recommended for small children without Adult supervision

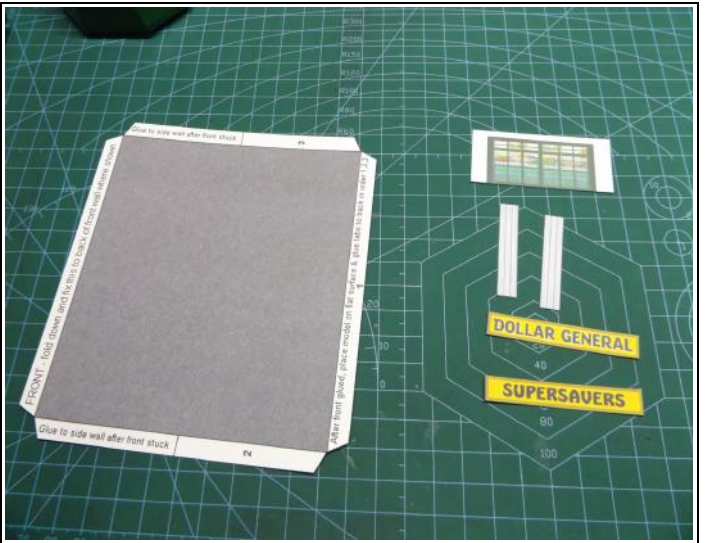

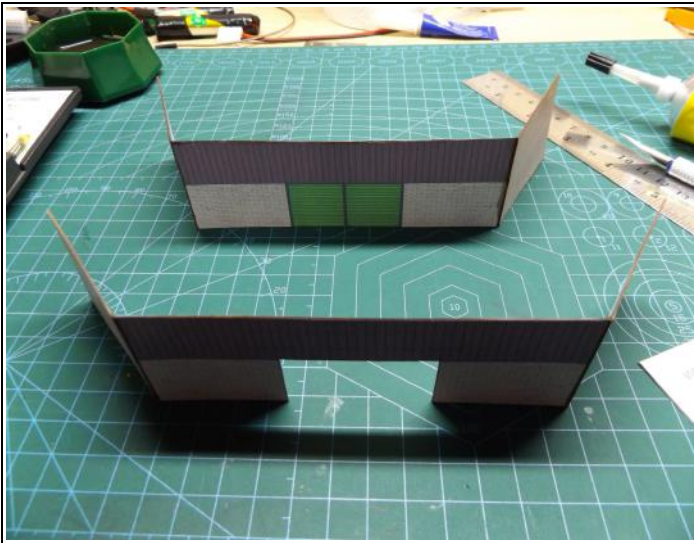

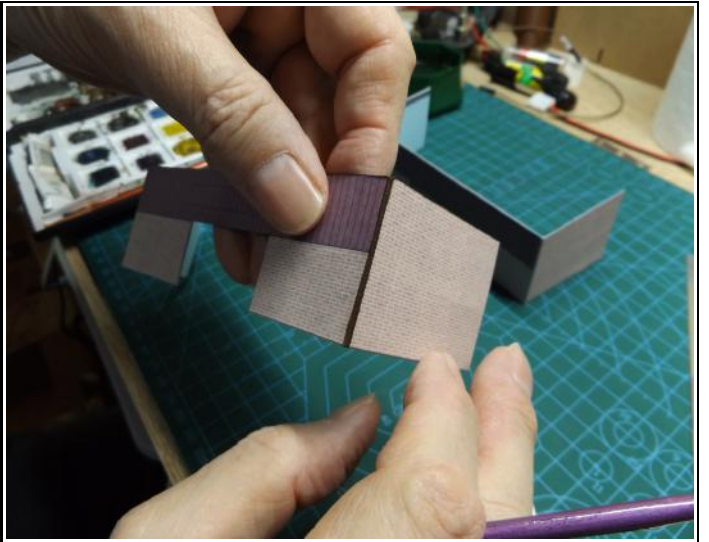

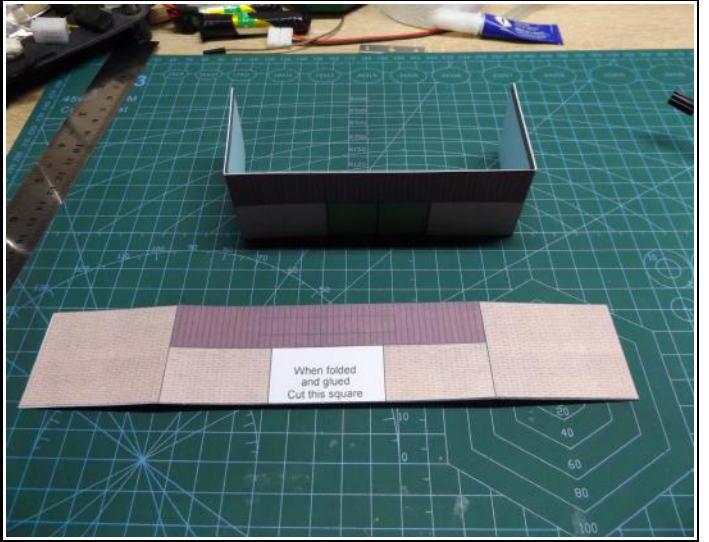

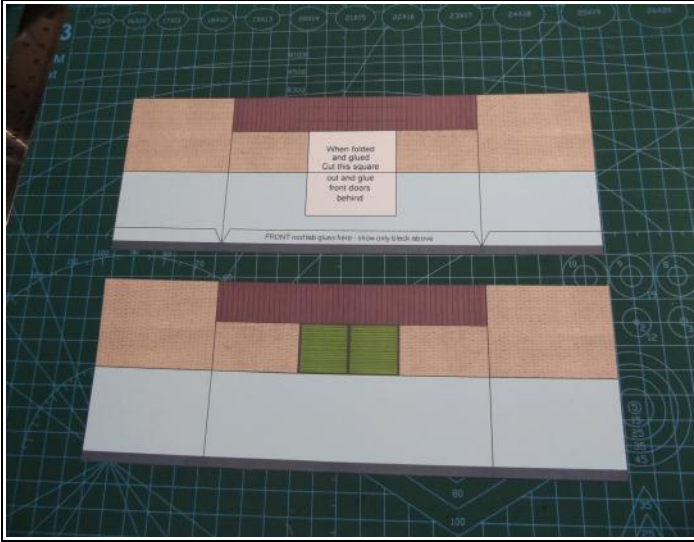

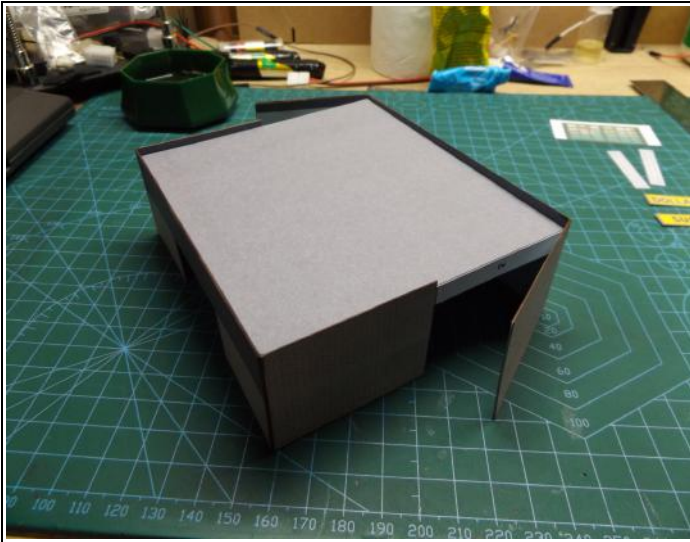

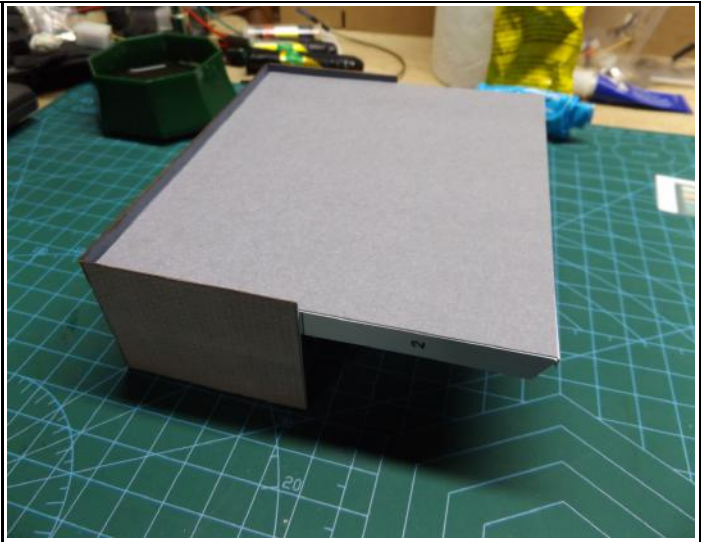

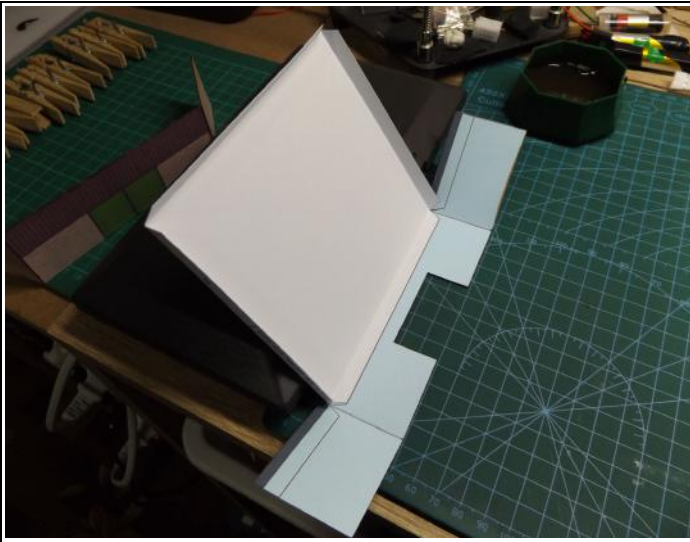

To build this you need the following:

1. A fine sharp craft knife
2. UHU hart adhesive or similar (quick drying)
3. Metal rule

First print out the pdf file plans directly onto A4 thin card or onto A4 paper which you then stick to thin card such as the plain inside of a cereal box.

1. Follow the instructions on Sheet 1 to create the front and back of the building. When each part is cut out you can optionally touch up any white edge areas carefully with a small brush and some water colour paint or some felt tip pens. This is especially effective on the bends at the corners of walls. Try to achieve a similar colour. I find a very watery solution works best as just a touch of the brush at right angles to the bent card sucks it up quite nicely. (see pictures below)
2. Cut out the area marked where the front entrance doors glue behind.
3. Follow instructions on Sheet 2 to fix the roof to the inside of the front section with the FRONT tab glued first. Then glue in place the two side walls of the front part. Once dried place the whole model on a flat surface. Then fold and align the back walls around the exposed roof section. Glue the main longer back wall tab first, followed by the two remaining sides. (see pictures below)
4. Glue the two service ducting strips over the outside of the wall joints on both sides.
5. Finally choose a sign and glue in place in the rectangle marked on the front wall.
6. The following pictures show me building the model.
